

# How to Achieve Your Carbon Neutral Goals

ABM can help you embed sustainability into your daily building operations. With our sustainable solutions portfolio, you can reduce your environmental footprint and achieve your carbon reduction goals while saving on operating costs. Our approach consists of:

## 1. Measure

We strongly believe that you cannot manage what you cannot measure. ABM's energy audits can identify opportunities to reduce energy consumption and carbon emissions to measure the financial and environmental impact of the strategies implemented.

## 2. Reduce

ABM can integrate passive strategies for reducing the energy demand in your building. Did you know this represents approximately 75% of the energy consumed in the U.S. building sector? We can help you improve the efficiency of your HVAC systems, lighting and ventilation services. Also, thanks to our Energy Savings Performance Contracting services we can propose budget neutral initiatives resulting in cost effective energy conservation measures.

## 3. Lead

Be a leader in the transition to a low carbon economy. We provide all the services to support the generation of on-site renewable electricity to compensate and balance the energy. ABM can take care of the installation of solar panels and glasses, electrical vehicle options and charging ports, windmill turbines, and carbon capture and storage units for compensating the residual carbon emissions.
